CareerNet — Sprint 2 Contribution Log

Project: CareerNet — Job Search and Application Tracking Platform
Course: SOEN 341 — Software Process
Sprint: Sprint 2 (October 8–26, 2026)
Task Scope: Dany's Frontend Tasks (DA-1 through DA-5)
Implementation: Dany

Work Session 1 — DA-1A: Shared API Helper

Date: 16/10/2026
Time Spent: 1.5 Hours
Task: DA-1 — Shared API Helper

Work Completed

- Created the feature/DA-1-api-helper branch from the latest main.
- Created src/api/client.ts with a reusable apiFetch() function.
- Added API base URL configuration using VITE_API_BASE_URL.
- Implemented automatic /api/v1 prefix handling.
- Added Bearer token authentication using the existing login token.
- Added support for JSON requests and multipart file uploads.
- Implemented error handling with readable messages and HTTP status codes.
- Added support for empty API responses and file downloads.
- Updated README.md with frontend API configuration instructions.
- Committed and pushed the implementation to GitHub.

Testing

- Successfully ran npm run build.
- Confirmed the Git branch was synchronized with main.
- Checked the Git changes before committing.
- Verified that only the intended two files were committed.

Challenges and Solutions

The original task guide referenced VITE_API_URL, while the existing project used VITE_API_BASE_URL. Followed the project's current configuration to maintain compatibility.

The backend feature endpoints were not available, so the helper was implemented and build-verified. Live API integration testing remains pending.

GitHub References

- Branch: feature/DA-1-api-helper
- Commit: 757665a
- Pull Request: https://github.com/Sayf-01/SOEN341-2026/pull/96

Status: Implementation completed, committed and pushed. Pull Request submitted for review.

Work Session 2 — DA-1B: Job Listing Page

Date: 16/10/2026
Time Spent: 2 Hours
Task: DA-1 — Job Listing Page with Mock Data

Work Completed

- Created the feature/DA-1-job-listing branch from main.
- Created src/types/job.ts with TypeScript interfaces for jobs, job details, and search parameters.
- Created src/mocks/jobs.ts containing 15 fictional job postings.
- Used the six official job categories and locations from Kaila's sample-job script.
- Included one closed job posting for future testing.
- Created src/api/jobs.ts with searchJobs() and getJob() functions.
- Implemented pagination with 10 job postings per page.
- Created a reusable JobCard component.
- Created JobsPage.tsx to display job listings.
- Implemented loading, empty, and error states.
- Added Previous and Next pagination buttons.
- Added a protected /jobs route in App.tsx.

- Added a Find Jobs link to Navbar.tsx.
- Committed and pushed the changes to GitHub.

Testing

- Successfully ran npm run build.
- Tested the Job Listing Page using mock authentication.
- Confirmed that page 1 displayed 10 jobs and page 2 displayed 5 jobs.
- Verified that Previous and Next buttons worked correctly.
- Confirmed that pagination buttons were disabled on the appropriate pages.
- Verified that job cards displayed the required information.
- Confirmed that logged-out users could not access the protected Jobs Page.
- Checked the staged files before committing.

Challenges and Solutions

The real backend job endpoints were not available, so fictional job data was used.

Separated mock API functions from the frontend components to simplify future backend integration.

The Job Detail Page and search filters were intentionally left for DA-3 and DA-2.

GitHub References

- Issue: https://github.com/Sayf-01/SOEN341-2026/issues/43
- Branch: feature/DA-1-job-listing
- Commit: 91fb1d8
- Pull Request: [Add PR link once created]

Status: Implementation, manual testing, build verification, commit, and push completed.

Work Session 3 — DA-2: Search and Filter Controls

Date: 16/10/2026
Time Spent: 2 hours
Task: DA-2 — Search and Filter Controls

Work Completed

- Created the feature/DA-2-search-filters branch from the DA-1 Job Listing branch.
- Created src/constants/jobFilters.ts containing the six official job categories and six locations.
- Updated src/api/jobs.ts to support keyword, location, and category filtering.
- Implemented case-insensitive keyword searches across job titles, company names, and descriptions.
- Implemented combined filtering, requiring jobs to match all selected criteria.
- Updated src/pages/JobsPage.tsx with a keyword input, location dropdown, category dropdown, Search button, and Clear Filters button.
- Implemented automatic pagination reset to page 1 when applying new filters.
- Added a friendly message when no jobs match the selected filters.
- Improved the text and background colours of the Clear Filters button to make it more readable.
- Committed and pushed the changes to GitHub.
- Created Pull Request #98 for review.

Testing and Validation

- Successfully ran npm run build.
- Completed 11 manual tests, all passing.
- Verified searches using lowercase and uppercase keywords.
- Tested individual location and category filters.
- Tested combined filters.
- Confirmed that searches with no matches displayed the correct message.
- Verified that Clear Filters restored all 15 jobs.
- Confirmed pagination reset and Previous/Next button behaviour.
- Checked staged changes using git diff --cached --check.

Challenges and Solutions

The original Clear Filters button had a readability issue due to its text and background colours. Adjusted the styling to improve visibility.

Kept the filtering logic inside the mock API rather than directly in the React page to simplify future backend integration.

GitHub References

- Issue: https://github.com/Sayf-01/SOEN341-2026/issues/44
- Branch: feature/DA-2-search-filters
- Commit: 0dc249b
- Pull Request: https://github.com/Sayf-01/SOEN341-2026/pull/98

Status: Implementation complete. Build and manual testing passed. Committed, pushed, and submitted for review.

Work Session 4 — DA-3: Job Detail Page

Date: 17/10/2026
Time Spent: 2 hours
Task: DA-3 — Job Detail Page with Mock Data

Work Completed

- Created the feature/DA-3-job-detail branch from the DA-1 Job Listing branch.
- Created src/pages/JobDetailPage.tsx.
- Implemented dynamic job loading using the job ID from the URL.
- Used the existing getJob() mock API function to retrieve complete job information.
- Displayed job title, company, location, category, posting date, status, and full description.
- Added a Back to Jobs navigation link.
- Implemented loading and error states.
- Added a Job not found message for invalid or nonexistent job IDs.
- Displayed Open and Closed status labels.
- Prevented closed job postings from displaying an application option.
- Added a clearly marked integration point for the existing KR-3 Apply Dialog.
- Added the protected /jobs/:id route in src/App.tsx.
- Committed and pushed the implementation.

- Created Pull Request #99 for team review.

Testing and Validation

- Successfully ran npm run build.
- Completed seven manual tests successfully.
- Verified navigation from JobCard to Job Detail.
- Confirmed that different job IDs displayed the correct information.
- Tested the Back to Jobs link.
- Verified that closed jobs displayed the correct message.
- Tested invalid and nonexistent job IDs.
- Confirmed that unauthenticated users were redirected to the login page.
- Checked the staged changes using git diff --cached --check.

Challenges and Solutions

The existing KR-3 Apply Dialog was developed on a separate branch and was not yet available in DA-3.

Added a clearly marked integration point instead of duplicating the component or mixing unrelated branch changes.

Used mock job data because the backend job detail endpoint was not yet available.

GitHub References

- Issue: https://github.com/Sayf-01/SOEN341-2026/issues/45
- Branch: feature/DA-3-job-detail
- Commit: e42428f
- Pull Request: https://github.com/Sayf-01/SOEN341-2026/pull/99

Status: Job Detail Page implemented and manually tested. Changes committed, pushed, and submitted for review. KR-3 Apply Dialog integration remains pending.

Work Session 5 — DA-4: My Applications Page

Date: 17/10/2026
Time Spent: 2.5 hours
Task: DA-4 — My Applications Page (Mock Data)

Work Completed

- Created the feature/DA-4-my-applications branch from the latest main.
- Created src/types/application.ts containing the MyApplication interface and five application statuses: Applied, Under Review, Interview, Offered, and Rejected.
- Created src/mocks/applications.ts with eight fictional applications covering all five statuses.
- Implemented a reusable StatusBadge component with status-specific colours and readable text.
- Created src/api/myApplications.ts with an asynchronous getMyApplications() function and simulated network delay.
- Created src/pages/MyApplicationsPage.tsx.
- Displayed job title, company, application date, last updated date, and status for each application.
- Implemented sorting by application submission date, newest first.
- Added loading, error, and empty states.
- Added horizontal table scrolling for smaller screens.
- Added a protected /applications route in src/App.tsx.
- Added a My Applications navigation link in src/components/Navbar.tsx.
- Committed and pushed all DA-4 changes to GitHub.
- Created Pull Request #100 for team review.

Testing and Validation

- Successfully ran npm run build.
- Completed all seven manual tests successfully.
- Verified that all eight fictional applications appeared.
- Checked all five application status badges.
- Confirmed that the application information and dates displayed correctly.

- Verified newest-first sorting.
- Confirmed navigation through the My Applications link.
- Tested horizontal table scrolling.
- Confirmed unauthenticated users were redirected to the login page.

Challenges and Solutions

The existing KR-3 Apply Dialog uses an applications.ts API file on a different branch. To avoid filename conflicts, created a separate myApplications.ts API module for DA-4.

Used fictional application data until backend endpoints become available. Designed the page to retrieve data through a dedicated API function so the mock implementation can be replaced during integration.

GitHub References

- Issue: https://github.com/Sayf-01/SOEN341-2026/issues/48
- Branch: feature/DA-4-my-applications
- Commit: 9e75721
- Pull Request: https://github.com/Sayf-01/SOEN341-2026/pull/100

Status: Mock-based My Applications Page completed, tested, committed, pushed, and submitted for review. Real backend integration remains pending.
